

# How To Setup Bot In MT5

## 1. Save the EA file

- Copy the entire code I gave you.
- Open **Notepad** (or any text editor).
- Paste the code.
- Save as:  
**GoldScalperEA\_MTF.mq5**  
(Make sure the extension is .mq5, not .txt)

## 2. Put the file in the correct folder

1. Open **XM MetaTrader 5**.
2. Click **File** → **Open Data Folder**.
3. Go into the folder:  
MQL5 → Experts
4. Paste / copy the GoldScalperEA\_MTF.mq5 file into the **Experts** folder.
5. Close the folder.

## 3. Compile the EA

1. In MT5, press **F4** (or click **Tools** → **MetaQuotes Language Editor**).
2. In MetaEditor, open the file GoldScalperEA\_MTF.mq5 (from the Navigator on the left under Experts).
3. Click the **Compile** button (or press F7).
4. Make sure there are **0 errors**.  
(If you see errors, tell me the exact error message.)

## 4. Attach the EA to the chart

1. Go back to MT5.
2. In the **Navigator** panel (Ctrl+N if hidden), expand **Expert Advisors**.
3. You should now see **GoldScalperEA\_MTF**.
4. Open a **XAUUSD M1** chart (recommended).
5. **Drag and drop** the EA onto the chart.
6. A settings window will open:
  - Go to the **Inputs** tab and adjust if needed (Risk %, Telegram, etc.).
  - Check **Allow Algo Trading**.
  - Check **Allow DLL imports** (if asked).
  - Click **OK**.

## 5. Important settings you must enable

1. At the top of MT5, make sure the **AutoTrading** button is **green/ON**.
2. Go to **Tools** → **Options** → **Expert Advisors** tab:
  - ✓ Allow algorithmic trading
  - ✓ Allow WebRequest for listed URL  
→ Add this exact URL:  
<https://api.telegram.org>
  - Click OK.

## 6. Check if it is working

- You should see a smiling face ☺ in the top-right corner of the chart.
  - The dashboard (Comment) should appear on the chart showing the cascade status (D1→H4→H1...).
  - If Telegram is enabled, you should receive a message that the bot is online.
- 

### Quick checklist if it does not work:

- AutoTrading button is ON (green)
- Smiling face appears on the chart
- Chart is XAUUSD M1
- WebRequest URL <https://api.telegram.org> is added
- You compiled with 0 errors

Would you like me to also give you the **recommended input settings** for higher win-rate (more selective) or more aggressive settings?
